Sign in and find your work

Your role and firm determine which modules, actions and records you can open.

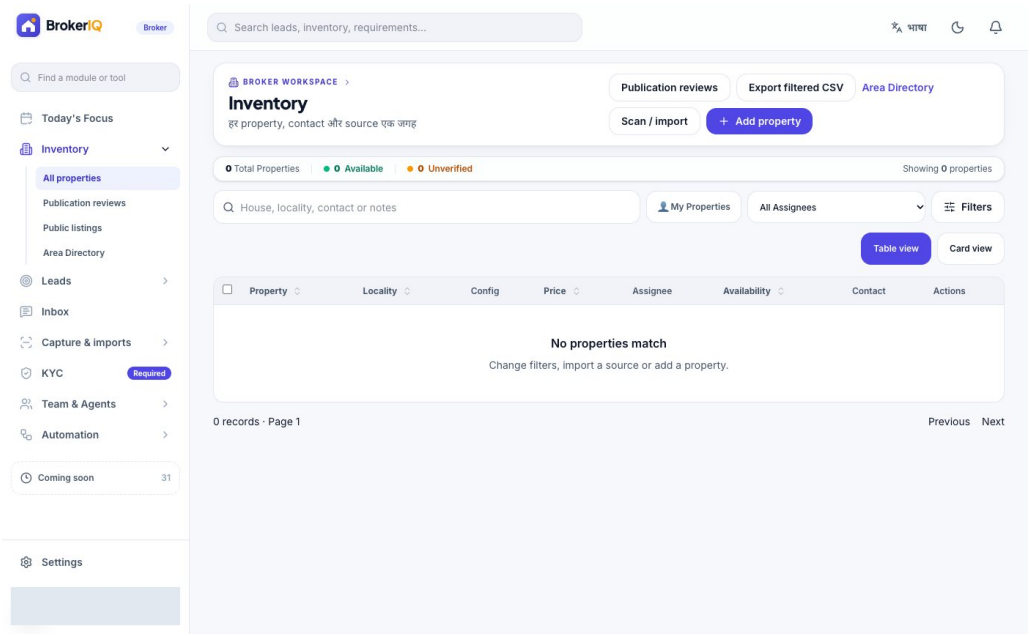

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. Open Broker Portal from the landing page or sign in to the BrokerIQ Android app. Enter your registered email and password.
2. Enter the email OTP when prompted. If five devices are already signed in, choose the device you want to sign out.
3. Start with Today's Focus. Open a KPI to see its records. On Android use the Broker tabs, the header notification bell and Profile & Settings.

Broker Admins work across their firm. Agents see assigned leads and the inventory and tasks available to their account. Use the notification bell for the destination associated with a record.

Maintain inventory and publish

Inventory holds properties. Requirements hold client needs and source material for review.

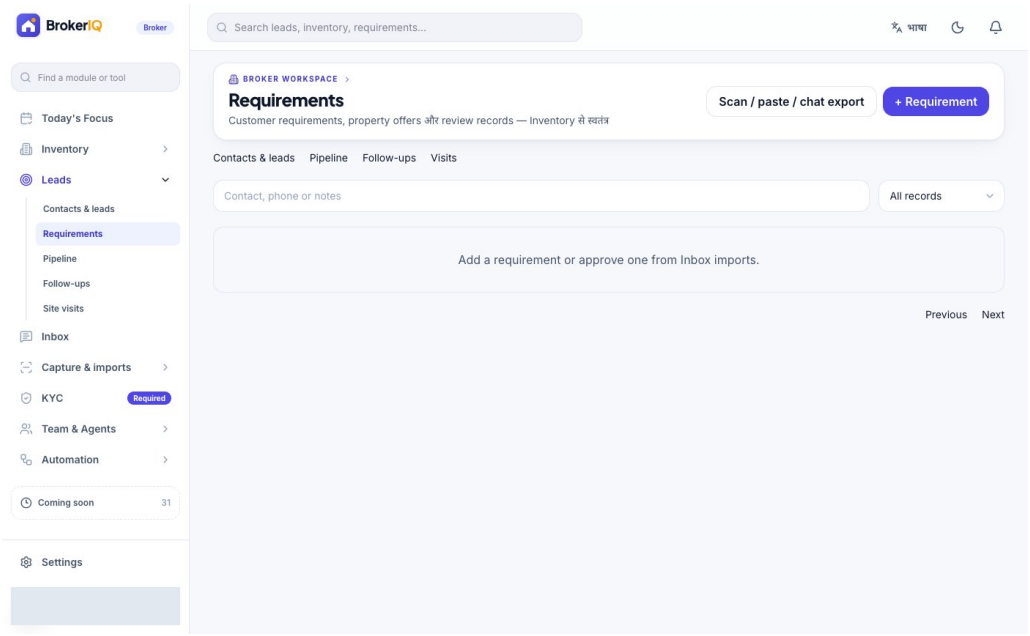

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. Open Inventory and narrow the list by locality, configuration, availability or assignee. Open the specific floor or unit before editing.
2. Add or update the property, price, purpose and availability using facts you can confirm. Save the record and reopen it to check the details.
3. Choose Publish on an eligible record. Review the public fields and selected photos. The listing screen shows whether publication is pending, published, rejected or withdrawn.

Verified firm admins can publish eligible records. Agent submissions go through the applicable firm or platform review. Update availability when a property is rented or sold.

Review imports and requirements

Keep the original source and confirm the structured details before using an extracted record.

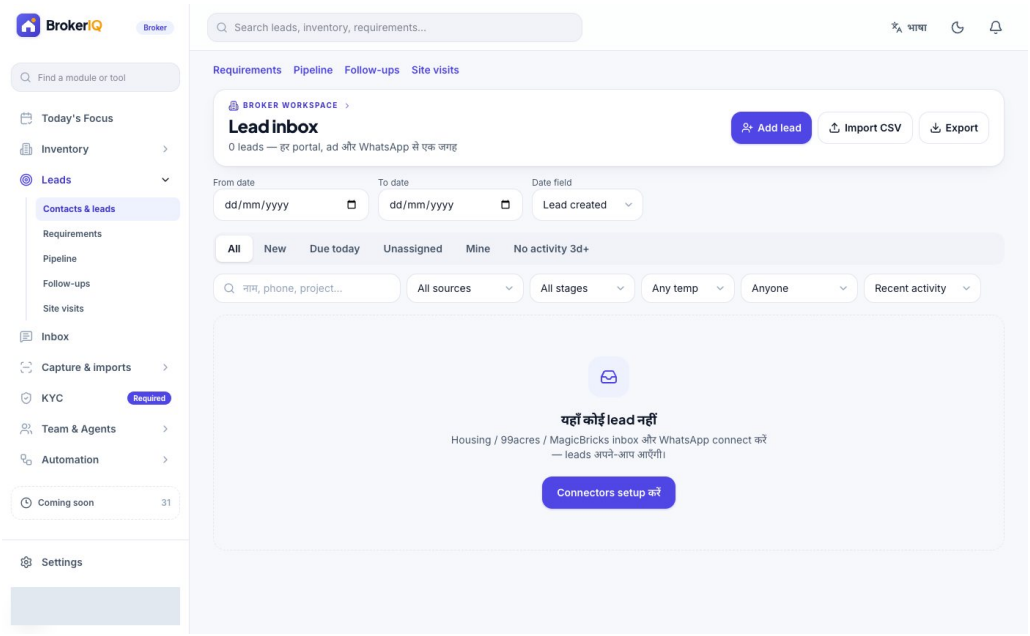

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. Open Requirements or Imports. Add the relevant shared text, WhatsApp export, scan or supported file using the available capture control.
2. Review each proposed entry against the original message or image. Check locality, unit, rent or sale, price and whether it is a request or an offer.
3. Confirm a valid requirement. For an available property, review and explicitly convert the offer to Inventory. Open the new inventory record and verify the fields.

Use the review state for unclear source material. When an upload pauses, open its existing batch and resume or retry there. Check the result before starting a second import.

Work leads, follow-ups and visits

Use the lead record to track the client, stage, next action and appointment together.

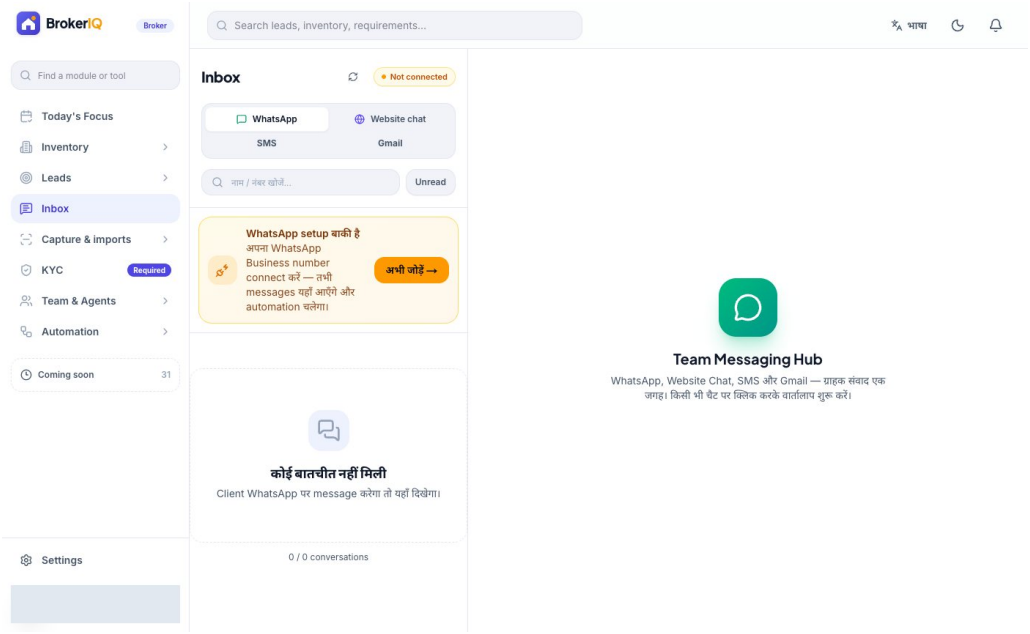

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. Open Leads. Search the contact before creating a new record. Use Pipeline to check its stage and a permitted assignment control to choose an owner.
2. From the lead or Follow-ups, set the due date and action. Use due-today and overdue filters to work the next items.
3. Schedule a Site Visit with the exact property unit or a custom address. Check the date and time, then reopen Visits to confirm its status.

If a follow-up or visit save is queued while offline, return to the same account and reopen the saved draft. Confirm the server status before creating another record.

Communicate from the lead

Open the client thread from its lead so the conversation stays associated with the correct contact.

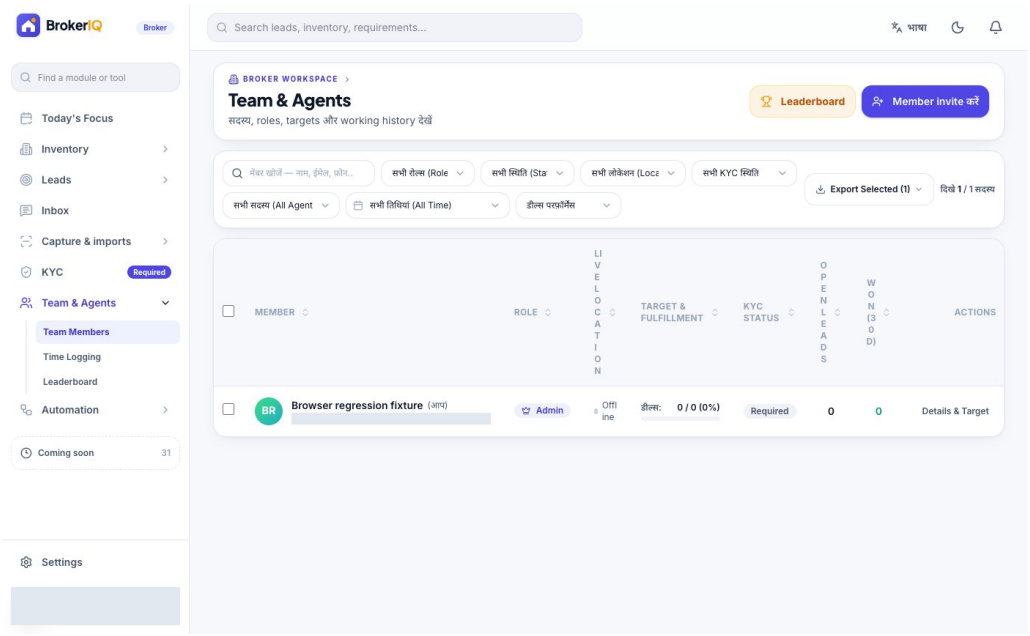

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. On Android, use the labelled Call, WhatsApp, SMS and Email icons in Lead Details. Choose a messaging icon to open the composer for that lead, or open the matching Inbox tab.
2. Check the recipient and edit the draft before sending. For email, enter a subject or reply within the existing thread.
3. Read the status in the conversation. Check an uncertain provider response in delivery history or Sent before retrying.

A missing connector opens its setup path for the firm admin. Gmail and SMS availability depends on the firm's approved connection and provider status.

Manage team and verification

Use the member page for responsibilities and the KYC workspace for document review.

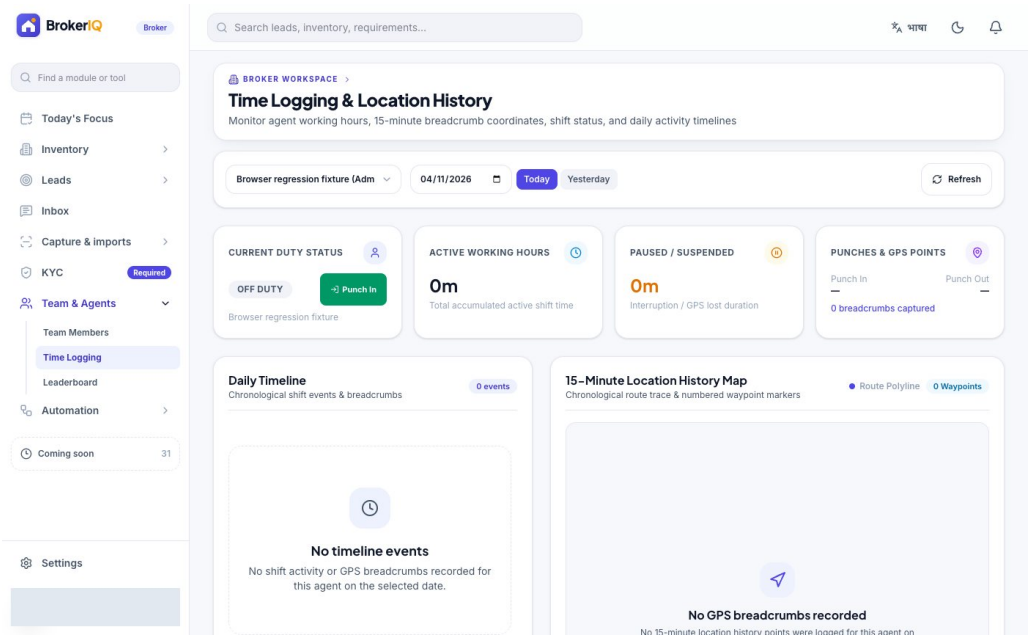

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. As Broker Admin, open Team & Agents. Invite a member, check the invite status and use their member page for permitted edits and assignments.
2. As Agent, open KYC to submit your own documents. Follow the camera prompts, review each required photo and use retake when needed.
3. Use KYC to see pending, rejected or verified submissions. Read the review note and replace the rejected files when resubmission is available.

Export only the permitted filtered or selected records. Treat KYC downloads as private and share them only through your authorized process.

Record shifts and field visits

Time Logging shows shift state and the last recorded location time.

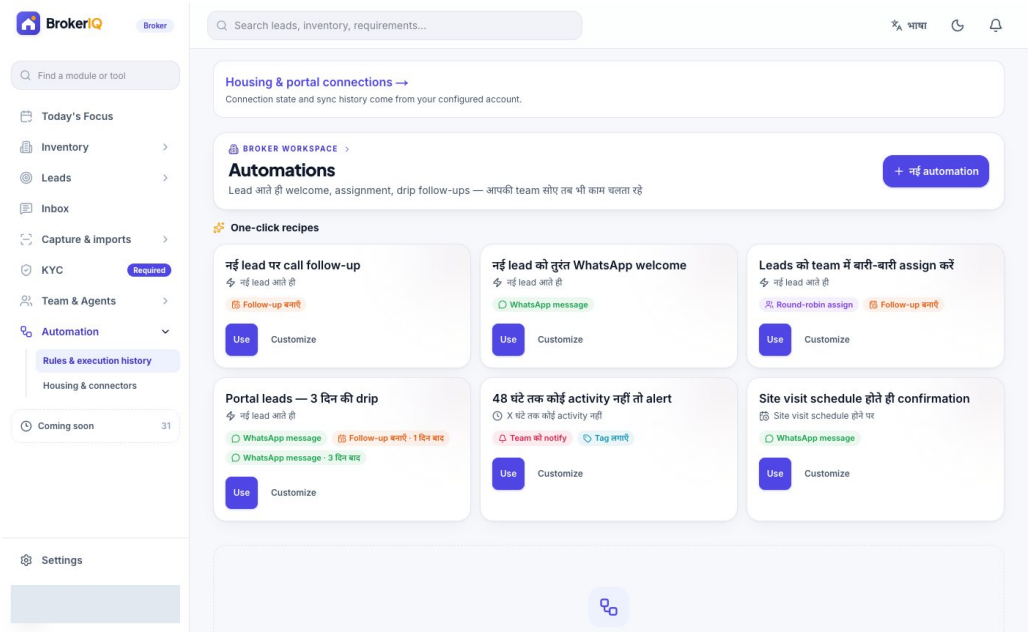

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. Open Time Logging and check the account. Allow the requested location access when you intend to start an active tracked shift.
2. Punch in and confirm the active state. Use Pause, Resume and Punch out for the intended shift transition.
3. If GPS or the network drops, review the current state and last updated time. Restore access and let pending items sync from the same account.

Android tracking depends on granted permissions and device power settings. A stale timestamp means the displayed location is historical.

Review automations and invoices

Use the dedicated workspaces for rule history, team performance and brokerage invoices.

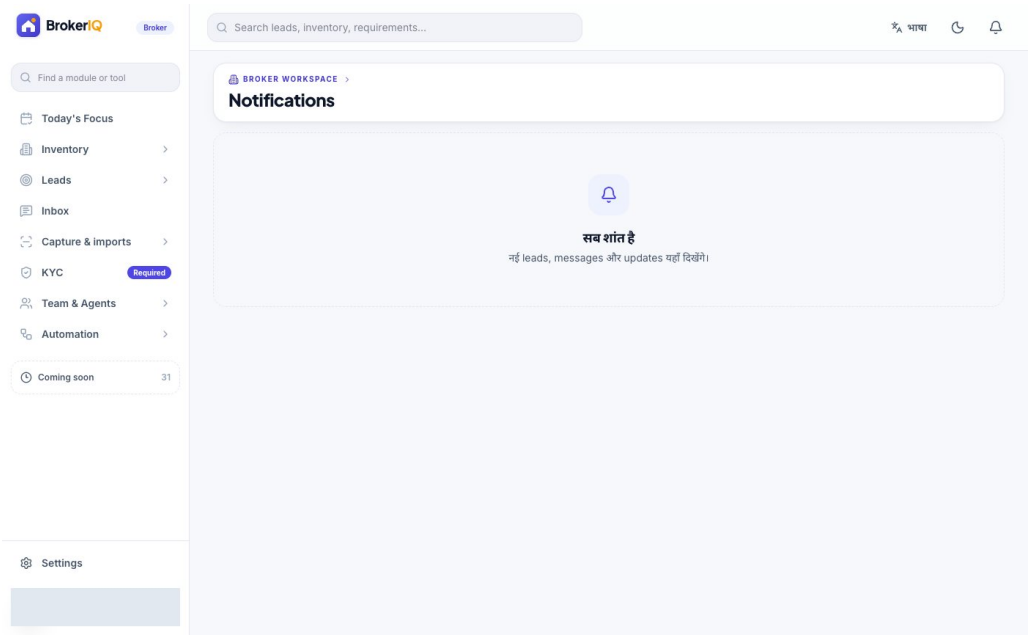

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. As Broker Admin, open Automation and review the rule trigger, action and connection. Use Run history to check an execution before enabling a rule or retrying an action.
2. Open the member page to review permitted targets. In Leaderboard or Performance, check the selected period and available results.
3. Open Invoices and choose the relevant client and deal. Review the invoice number, amount and payment details before sharing. Record payment only after confirming it.

Permission, connection and status checks still apply when an automation or invoice action is opened from another screen.

Resolve a blocked step

Use the account, module and visible status to identify the next step.

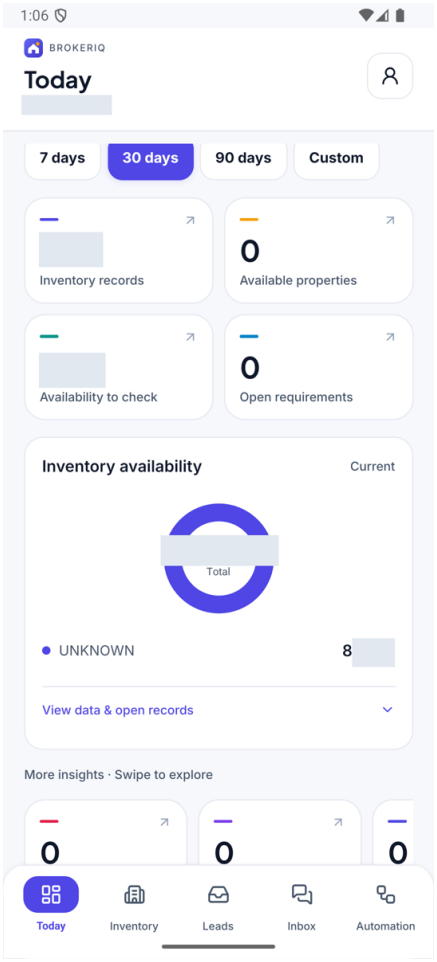

Isolated web workspace / Build 55 / 04 Nov 2026 IST

1. For OTP problems, check the registered mailbox and spam folder. Use the resend control after its timer and enter the latest code.
2. For missing work, check the selected firm, role and filters. Ask your firm admin to verify assignment and permissions.
3. For provider or upload errors, note the time and visible status and open the linked setup or existing batch. Share only the error and relevant record reference with support.

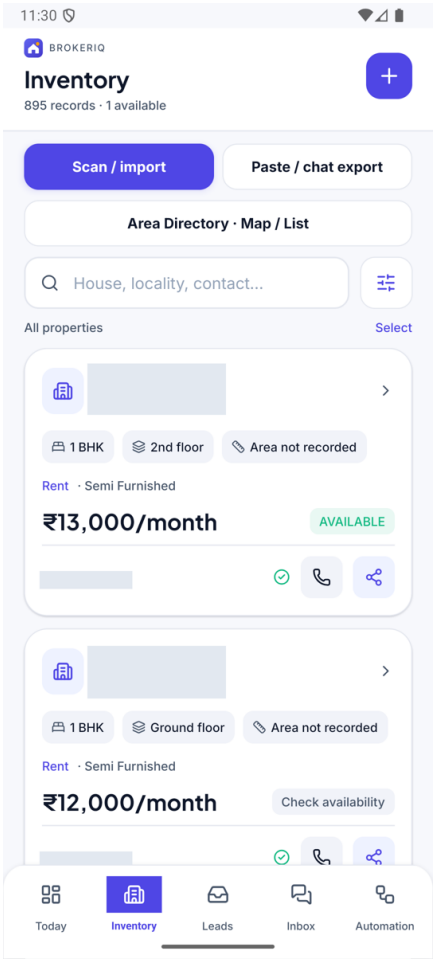

Find the Android version and published date on the BrokerIQ landing page. Use the signed download there when your administrator asks you to update.

Android screenshot reference

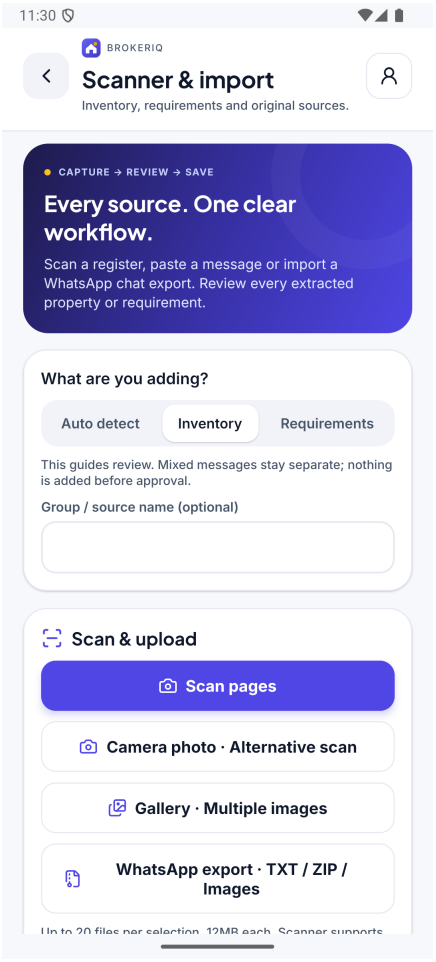

These archived Android captures show the build noted below each screen. Follow the steps in this edition for the current interface.
