Contents

01 Open the administration workspace 3

02 Inspect business records by firm 4

03 Review firms, members and shifts 5

04 Review KYC and publication 6

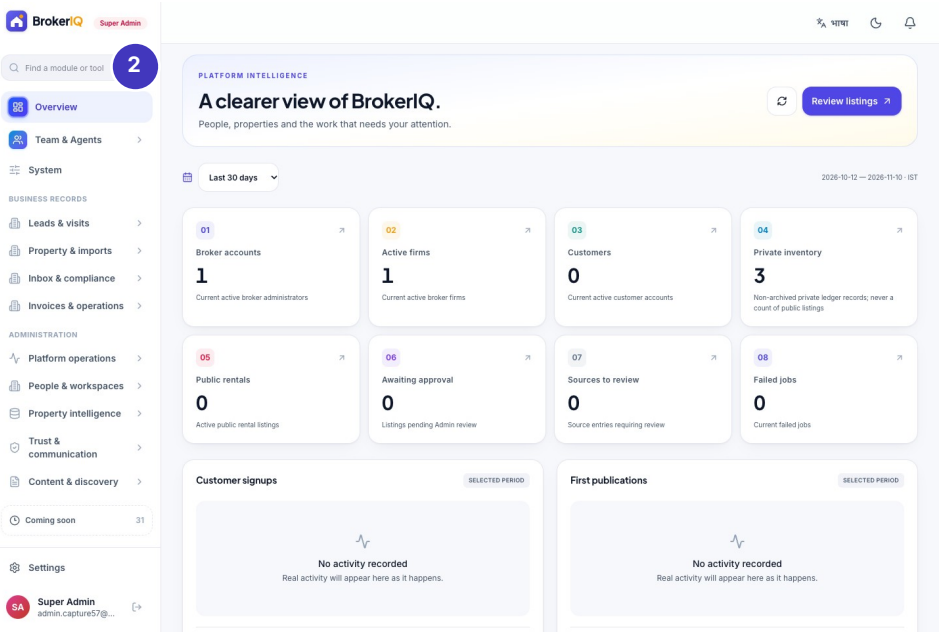

05 Manage integrations and delivery 7

06 Monitor operations and releases 8

07 Control access and review AI work 9

Open the administration workspace

The Super Admin workspace is the platform view. Use a firm filter for work concerning a single brokerage.

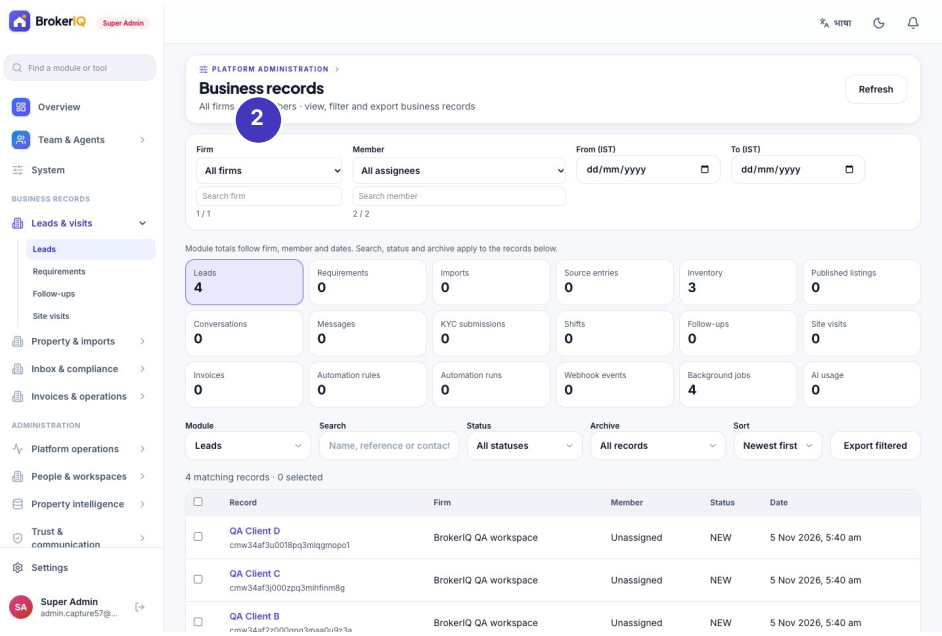

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:31 IST

1. Open Admin Login from the landing page. Enter your registered credentials and complete the email OTP challenge.
2. Start at Overview. Use Find a module or tool in the sidebar. Expand a Business records group or an Administration group, then select the tool.
3. Use the notification bell for a linked action. If the record is unavailable, open its module and search with the appropriate scope.

Keep the Admin session on a trusted device. Use session management to revoke a device you no longer use.

Inspect business records by firm

Business records starts with the all-firms view and keeps the selected hierarchy when you open a record.

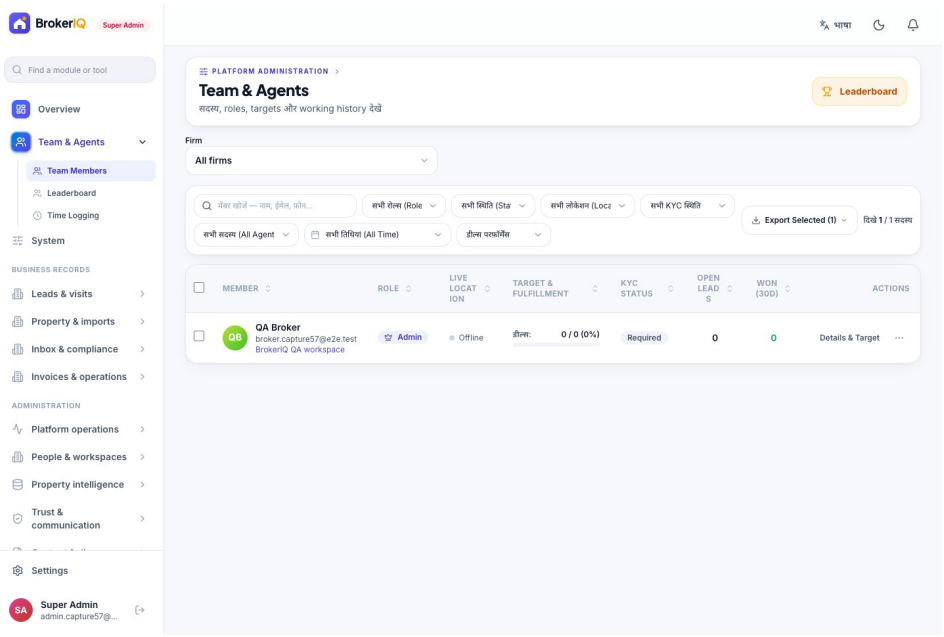

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:31 IST

1. Open Business records. Select the resource, such as leads, requirements, imports, inventory, listings, messages, visits, invoices or automation runs.
2. Choose a firm or keep all firms. Apply the supported member, date, status and archive filters. Compare the result count with the applied filters.
3. Open a record and follow its authorized related links. Return to the filtered list to continue reviewing or export the matching summary CSV.

Use dedicated Team, KYC, Inventory and System screens for actions and fields specific to those modules.

Review firms, members and shifts

Use firm and member filters together when reviewing the organization hierarchy.

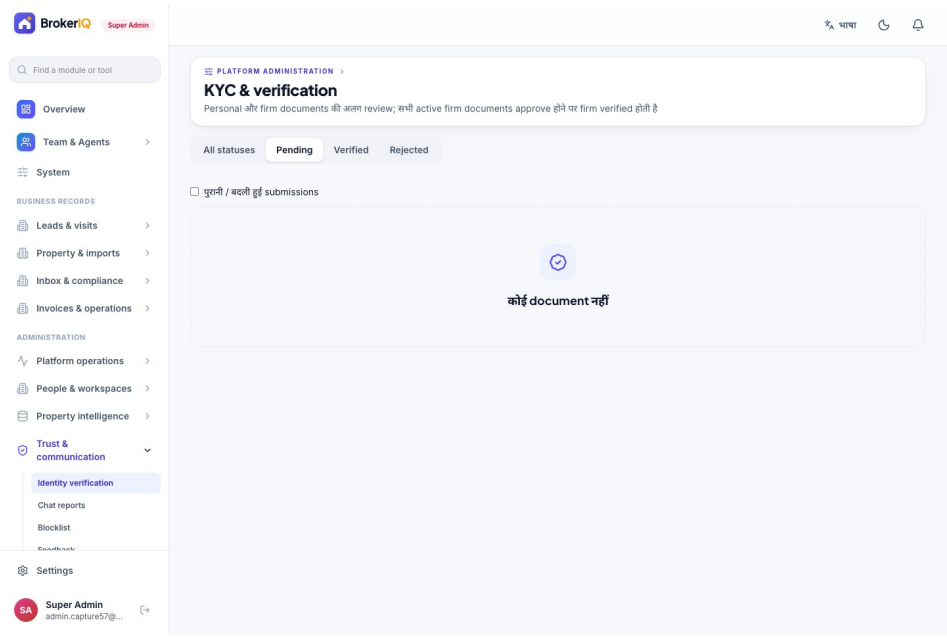

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:31 IST

1. Open Broker firms to find the firm. Check its status and choose the member or integration workspace for that firm.
2. Open Team & Agents and select the member. Confirm their role and assignment before a permitted promotion, suspension or reassignment.
3. Open Time Logging or Leaderboard. Apply the appropriate firm, member and date filters, then open the available details.

The last active firm administrator is protected. Check the new role and session state after membership changes.

Review KYC and publication

Keep verification decisions and public listing approvals in their dedicated queues.

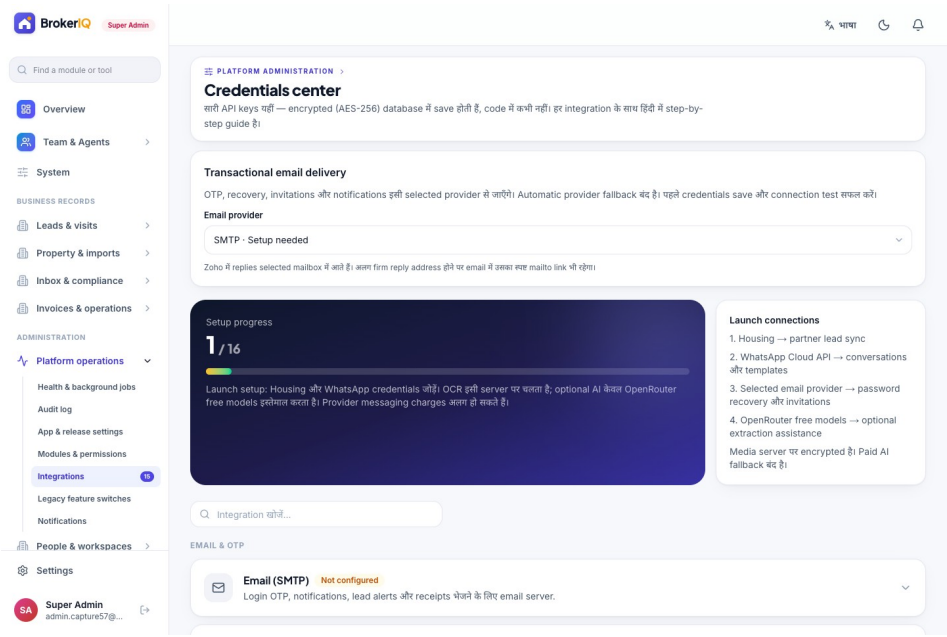

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:33 IST

1. Open KYC and filter by firm, member or submission status. Open an authenticated document preview for the selected record.
2. Review the submitted documents and required photos. Record the authorized decision and any review note, then confirm the new status.
3. For listing publication, open the Inventory or listing review workflow. Check firm ownership, availability and the public preview before deciding.

Treat KYC previews and exports as private. Share the public listing link after the listing reaches Published.

Manage integrations and delivery

Platform credentials and a firm's own connections are separate settings.

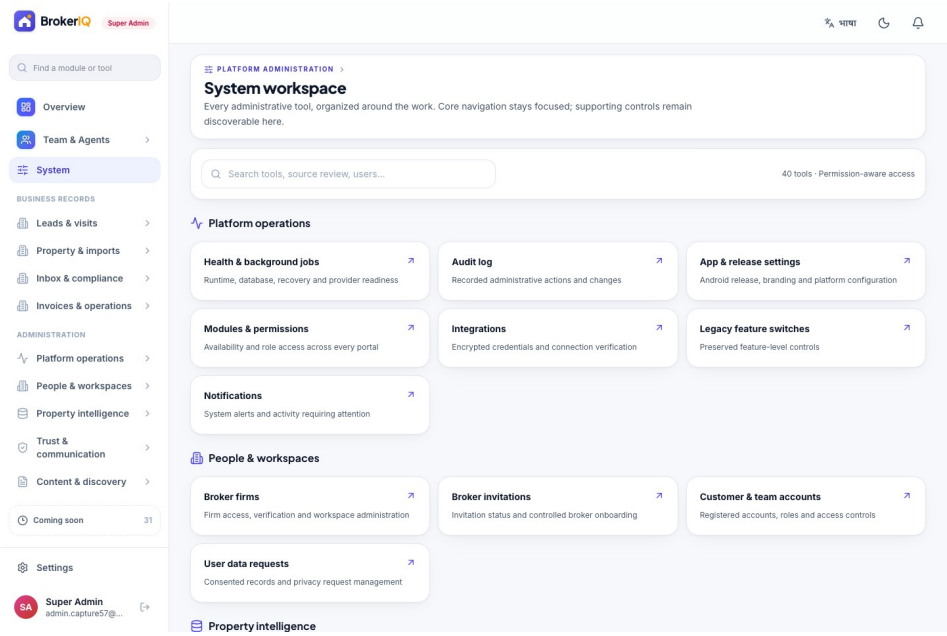

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:31 IST

1. Open Integrations for platform configuration. Review the selected transactional email provider and its test result before relying on OTP or invitations.
2. From Broker firms, open the specific firm's Integrations to check Housing, WhatsApp or Textbee. Check that the device and SIM belong to the firm before sending a diagnostic.
3. Set up the dedicated platform Gmail client. The firm's Broker Admin connects its own mailbox from its workspace. Check the grant mode and provider result.

Gmail Testing access is for the approved test mailbox. Review provider verification before a wider rollout. Keep API keys and tokens in encrypted settings.

Monitor operations and releases

Use System and the release record to separate health, provider delivery and app version evidence.

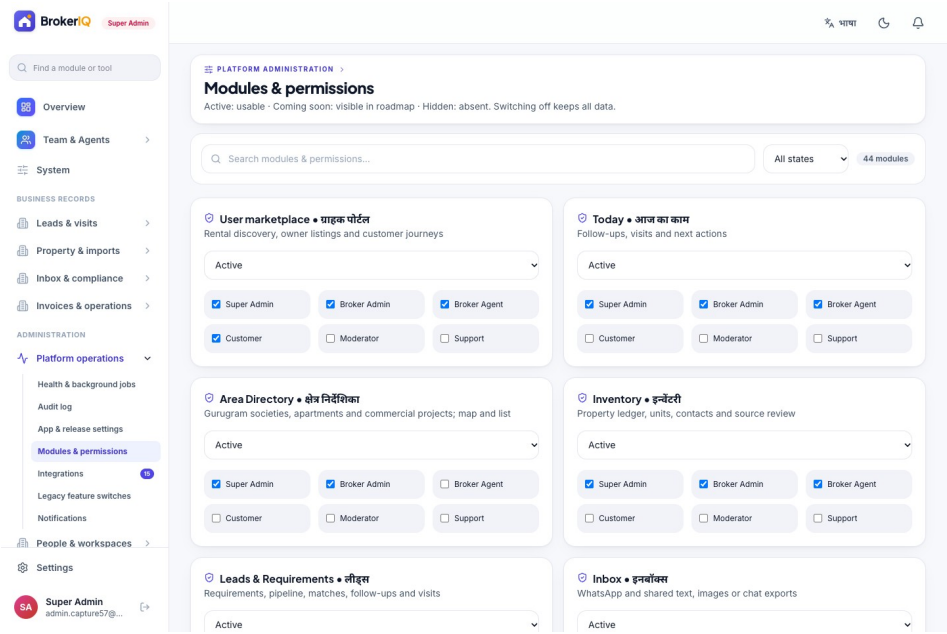

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:31 IST

1. Open System to check API, database, storage and background work. In Business records, select jobs, webhook events or automation runs to narrow a failure.
2. Before retrying a failed provider action, check the original delivery status and related record. Give support the time and record reference.
3. For a release, compare the landing page version and timestamp with the release record and signed APK checksum. Use the release runbook for backup and rollback.

Verify restore evidence in an isolated database. Keep the previous accepted release available until the new release is accepted.

Control access and review AI work

Apply module permissions and review rules to the people and firms that need them.

Web · Isolated QA workspace / Build 57 / 10 Nov 2026, 09:31 IST

1. Open Modules & permissions. Check the affected role and firm before saving a change. Verify that account's allowed and restricted routes.
2. Review the available AI provider and firm automation configuration. Use reviewed drafts for extracted facts and client-facing actions.
3. Use audit and job history to investigate changes. Escalate a suspected permission, data or delivery issue with its record, time and current release.

Keep KYC, publication and financial decisions in their human review flows.
